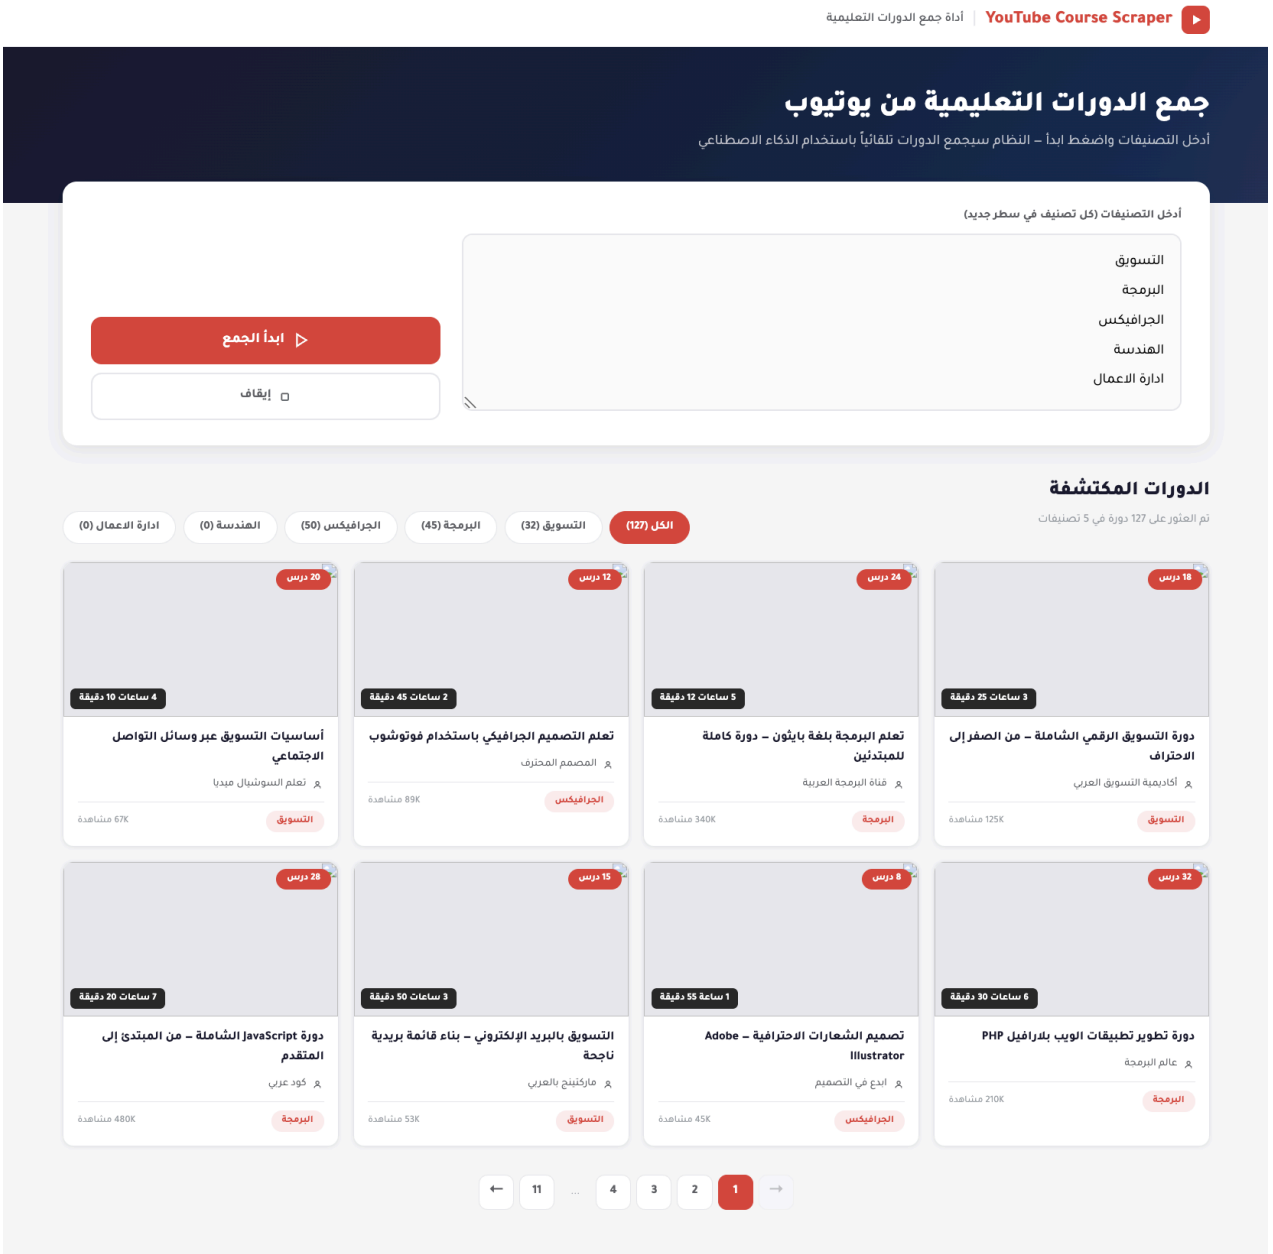
Youtube Scrapper - Backend - Test

Build a Laravel-based web application that discovers educational YouTube playlists (courses) using AI-generated search queries and displays them in a UI similar to the attached design.



The goal of this task is to evaluate:

- Backend logic and API integration
- Database design
- Basic frontend implementation (Bootstrap + custom CSS)
- Code clarity and structure

Requirements

1. Input (Categories)

On the main page, provide a textarea where the user can input categories (one per line), for example:

Marketing
Programming
Graphic Design
Business
Engineering

Add a button: **"Start Fetching"**

2. AI Integration

For each category:

- Use any AI API to generate **10–20 course titles** related to the category.

3. YouTube Search

For each generated title:

- Use **YouTube Data API** to search for playlists.
- Store **2 playlists per search query**.

4. Data Storage

Store playlists (courses) in the database with:

- Playlist ID (unique)
- Title
- Description
- Thumbnail
- Channel name
- Category

5. Deduplication

- Do not store duplicate playlists (based on playlist ID).

Frontend UI

Build a simple UI using:

- **Bootstrap**
- **Custom CSS (to match the attached design as much as possible)**

Deliverables

- Git repository
- Database migrations
- README with:
  - Setup instructions
  - **API keys configuration**
  - How to run the project

Evaluation Criteria

We will evaluate based on:

- Code clarity
- Correct use of APIs (AI + YouTube)
- Clean database structure
- UI implementation quality (Bootstrap + CSS)
- Deduplication logic
- AI usage detection + deep code understanding (even if AI-assisted)
